

EXPERIMENT

AIM

REST API Design with MongoDB + Mongoose Integration.

THEORY

1. What is a REST API?

- REST (Representational State Transfer) is an architectural style for building web services.
- A **REST API** uses HTTP methods (GET, POST, PUT, DELETE) to perform operations on resources.
- Each resource is represented by a **URL (endpoint)**, e.g. `/api/users`.

Example mappings:

- `GET /api/users` → Fetch all users
- `POST /api/users` → Add new user
- `PUT /api/users/:id` → Update user by ID
- `DELETE /api/users/:id` → Delete user by ID

Why MongoDB?

- **MongoDB** is a NoSQL database that stores data in flexible **JSON-like documents**.
- Useful for modern applications where schema can change dynamically.
- Example MongoDB document:

3. Why Mongoose?

- **Mongoose** is an ODM library for MongoDB and Node.js.
- It allows developers to:
 - Define **schemas** for data.
 - Create **models** to interact with MongoDB collections.
 - Perform CRUD operations easily.

4. REST API Workflow with MongoDB + Mongoose

1. **Client** sends requests (e.g., `GET /api/users`).
2. **Express server** receives request.
3. **Route handler** calls a **Mongoose model** to interact with MongoDB.
4. **The database** responds with data.
5. **Express** sends the response back to the client in JSON format.

5. Advantages of this Integration

- **Scalability:** MongoDB handles large datasets.
- **Flexibility:** JSON-like structure matches REST responses.
- **Productivity:** Mongoose simplifies queries with built-in methods.
- **Separation of Concerns:** REST API design keeps client and server independent.

STEPS

1) Create project and install deps

```
mkdir rest-experiment
```

```
cd rest-experiment
```

```
npm init -y
```

```
npm i express mongoose dotenv morgan express-async-errors
```

```
npm i -D nodemon
```

2) Create `.env` file

```
MONGO_URI=your_mongodb_uri_here
```

```
PORT=5000
```

```
NODE_ENV=development
```

SOURCE CODE

```
config > JS db.js > ...
1 // config/db.js
2 const mongoose = require('mongoose');
3
4
5 const connectDB = async () => {
6   try {
7     const conn = await mongoose.connect(process.env.MONGO_URI);
8     console.log(`MongoDB Connected: ${conn.connection.host}`);
9   } catch (error) {
10    console.error('MongoDB connection error:', error.message);
11    process.exit(1);
12   }
13 };
14
15
16 module.exports = connectDB;
```

```
controllers > JS userController.js > ...
1 // controllers/userController.js
2 const User = require('../models/User');
3
4
5 exports.createUser = async (req, res) => {
6   const { name, email, age } = req.body;
7   if (!name || !email) return res.status(400).json({ message: 'Name & email required' });
8   const userExists = await User.findOne({ email });
9   if (userExists) return res.status(400).json({ message: 'Email already used' });
10
11
12   const user = await User.create({ name, email, age });
13   res.status(201).json(user);
14 };
15
16
17 exports getUsers = async (req, res) => {
18   const users = await User.find().select('-__v');
19   res.json(users);
20 };
21
22
23 exports.getUserById = async (req, res) => {
24   const user = await User.findById(req.params.id).select('-__v');
25   if (!user) return res.status(404).json({ message: 'User not found' });
26   res.json(user);
27 };
28
29
```

middleware > JS errorMiddleware.js > ...

```
1 // middleware/errorMiddleware.js
2 exports.notFound = (req, res, next) => {
3   res.status(404).json({ message: `Not Found - ${req.originalUrl}` });
4 };
5
6
7 exports.errorHandler = (err, req, res, next) => {
8   const status = res.statusCode === 200 ? 500 : res.statusCode;
9   res.status(status).json({ message: err.message, stack: process.env.NODE_ENV === 'production' ? r
10  });|
```

models > JS User.js > ...

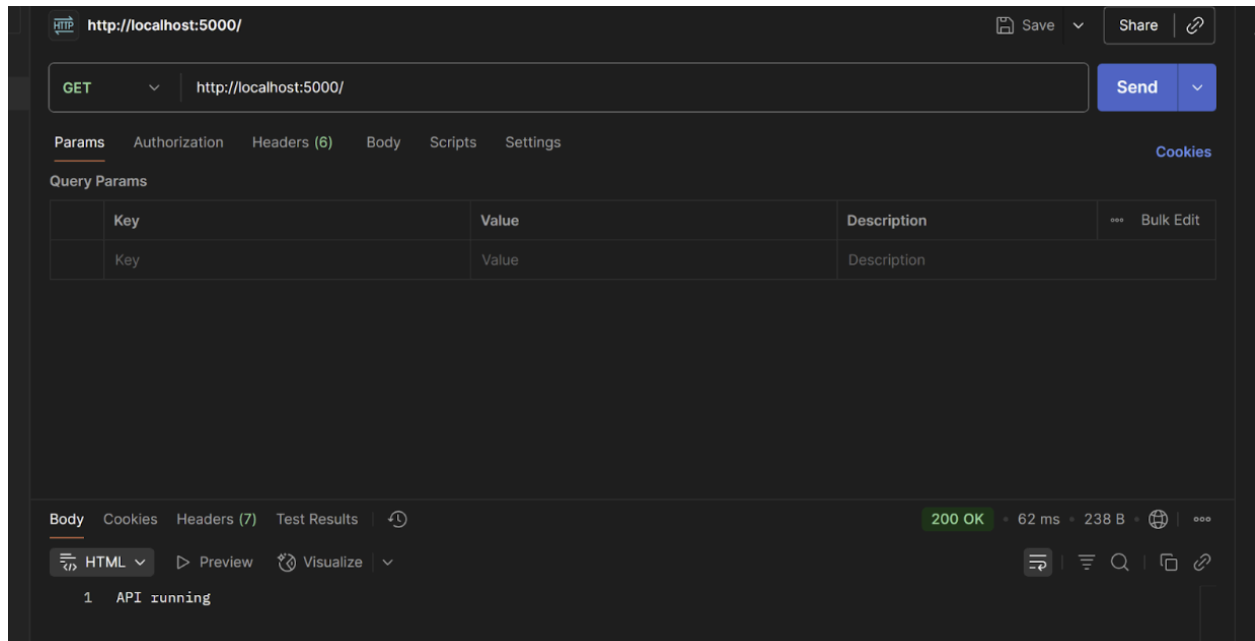

```
1 // models/User.js
2 const mongoose = require('mongoose');
3
4 const userSchema = new mongoose.Schema({
5   name: { type: String, required: true },
6   email: { type: String, required: true, unique: true },
7   age: { type: Number, default: null },
8   createdAt: { type: Date, default: Date.now }
9 });
10
11 // hide __v when converting to JSON
12 userSchema.set('toJSON', { transform: (doc, ret) => { delete ret.__v; return ret; } });
13 module.exports = mongoose.model('User', userSchema);|
```

routes > JS userRoutes.js > ...

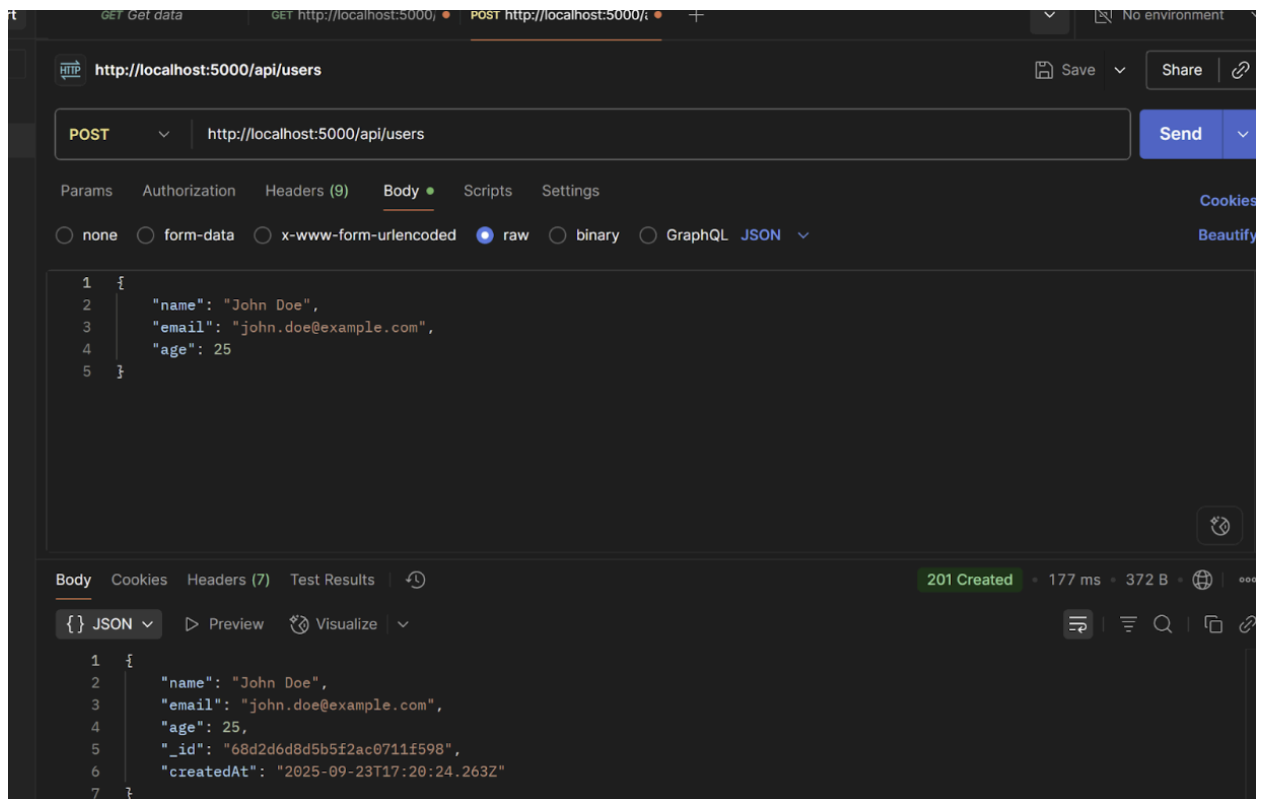

```
1 // routes/userRoutes.js
2 const express = require('express');
3 const router = express.Router();
4 const controller = require('../controllers/userController');
5
6
7 router.post('/', controller.createUser);
8 router.get('/', controller.getUsers);
9 router.get('/:id', controller.getUserById);
10 router.put('/:id', controller.updateUser);
11 router.delete('/:id', controller.deleteUser);
12
13
14 module.exports = router;
```

OUTPUT

Request 1: Check if server is alive

Request 2: Create a new user

Request 3: Get all users

REST client interface showing a GET request to `http://localhost:5000/api/users`. The request body is a JSON object:

```
1 {
2   "name": "John Doe",
3   "email": "john.doe@example.com",
4   "age": 25
5 }
```

The response is a 200 OK status with a JSON array containing one user object:

```
1 [
2   {
3     "_id": "68d2d6d8d5b5f2ac0711f598",
4     "name": "John Doe",
5     "email": "john.doe@example.com",
6     "age": 25,
7     "createdAt": "2025-09-23T17:20:24.263Z"
8   }
9 ]
```

Request 4 : Get user by ID

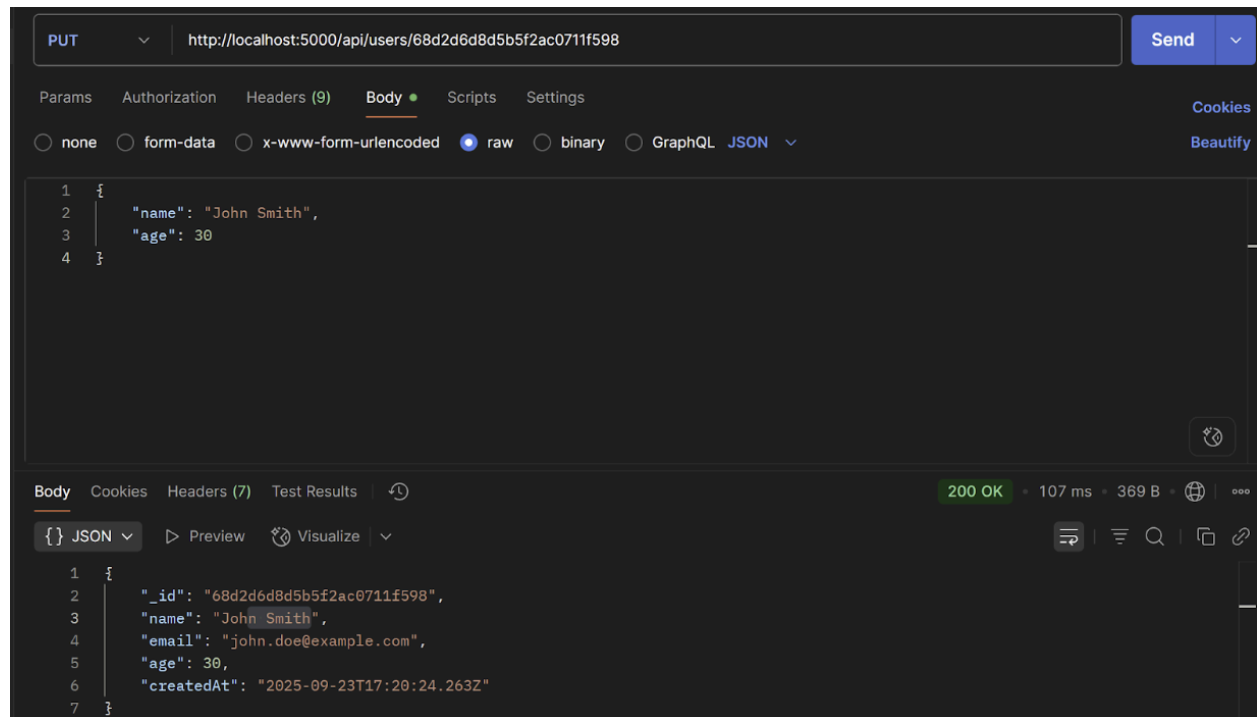

REST client interface showing a GET request to `http://localhost:5000/api/users/68d2d6d8d5b5f2ac0711f598`. The request body is a JSON object:

```
1 {
2   "name": "John Doe",
3   "email": "john.doe@example.com",
4   "age": 25
5 }
```

The response is a 200 OK status with a JSON object containing user details:

```
1 {
2   "_id": "68d2d6d8d5b5f2ac0711f598",
3   "name": "John Doe",
4   "email": "john.doe@example.com",
5   "age": 25,
6   "createdAt": "2025-09-23T17:20:24.263Z"
7 }
```

Request 5: Update user

CONCLUSION

This experiment demonstrated how to design a RESTful API using **Node.js, Express, MongoDB, and Mongoose**. It showed how CRUD operations can be performed efficiently with well-structured endpoints and how Mongoose simplifies interaction with MongoDB. The integration provides a scalable and flexible way to build modern backend applications.
